Project Information

Following section contains information about the project

Firstly, I created user class and called the variables there and made their constructor after that I extended passenger class and admin class from user class and inheritance is used there in both of these classes. Both the classes i.e passenger class and admin class there constructors are made.

After that passenger register JFrame is made and there the conditions are applied if any of the text field is left empty it will display message "Can't leave the field empty" in front of that text also if cnic text field is not up to 13 digits it will display message "Format not followed" in addition to it if user enter password that is shorter than 8 digit or longer than 15 digit it will display message "format not followed. Else will execute and inputs will be taken from the user which should not satisfy the above conditions and after that user will be taken to the Passenger login JFrame as passenger object is called here and composition is used on the signup button as the object is made

Then Passenger menu JFrame is made and composition is used on the Booking button, Main Menu button and back button.

Then passenger login JFrame is made and composition a type of association is used here as user click on the Login button he will be taken to the Passenger Menu JFrame.

When the text that user entered in the UserName field as well as the text that user entered in the password field of Sign up JFrame matches, user will be taken to the Passenger menu JFrame. But if it does not matches else condition will execute and invalid entry message will be displayed.

Also Composition is used when user click on the Sign up button which is present on the passenger login JFrame and the passenger will be taken to the Passenger Register JFrame

After that passenger local flight JFrame is made and Array List of flights is created and for each loop is used here to store the flights in the list and when user click on any flight, message will be shown to him that his flight is booked also price of the ticket will be shown to the passenger when he select his flight and when passenger click on any flight and then click on the cancel button his flight will be cancelled

Then Passenger International flight JFrame is made same as the passenger local flight. After that Passenger booking JFrame is made and composition is used here as user click on the Local button he will be taken to the Passenger Local JFrame also Composition is used when user click on the International button he will be taken to the Passenger International flight JFrame.

Menu JFrame is made here array list of passenger is created and Composition is used here as user click on the Admin Panel button he will be taken to the Admin Login JFrame also Composition is used here as user click on the Passenger Panel button he will be taken to the Passenger Login JFrame.

International flights class is created and parameterized constructor of International flights class is made also flights class is created and parameterized constructor of flights class is made

Admin menu JFrame is made When user click on the add flight button he will be taken to the admin add flight JFrame. Then admin login JFrame is made here Array list of admin username and admin password is created When user click on the login button he provides his input in the username and password text field and that is stored in username and password. When admin username and admin password matches i.e kamil and 12345678 to the text that user entered in the username and password text field he will then be taken to the admin menu JFrame else message will be displayed "invalid credentials"

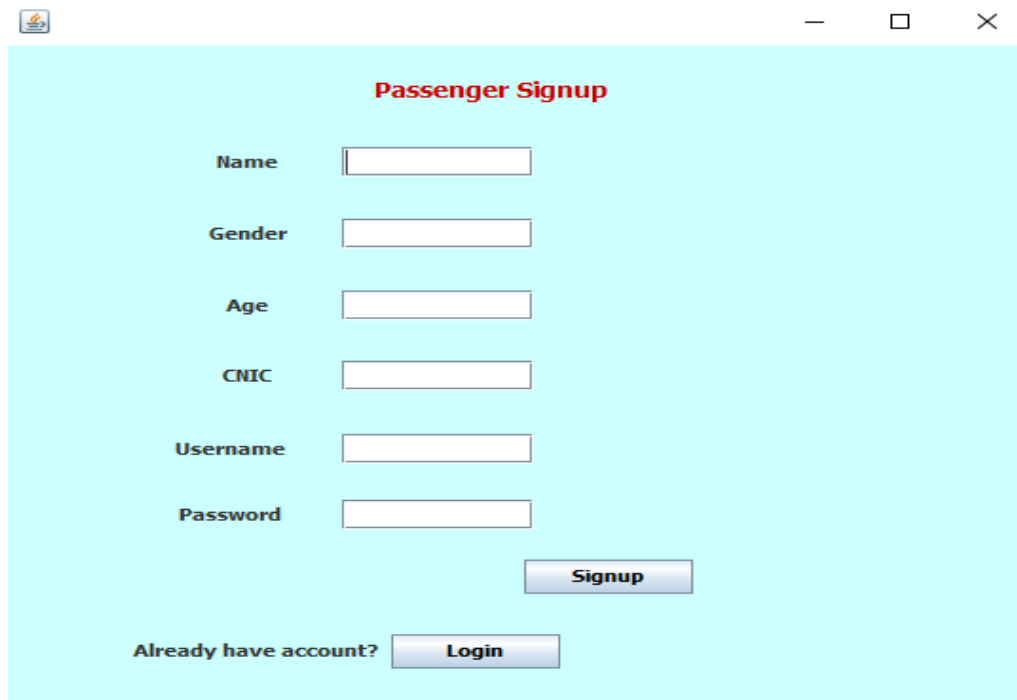

Admin local Flight JFrame is made and Array list of flights is created and for each loop is used here and it store the flights in the list. As admin select any field and then click on the remove button that flight will be removed. When admin click on the edit button he can edit the flight details. When admin click on the add button he can add new flights. As user click on the back button he will be taken to the admin add flight JFrame. Then admin international flight is also made like this but here international flight Array List is made.

Admin Add International entries JFrame is made as admin click on the add button the information will be stored in the Admin international flight. When admin will click on the view button he will be taken to the admin international JFrame and all the information that admin had added will be displayed there. Then Admin add entries JFrame is also made like admin add international entries

Lastly admin add flight JFrame is made here when user click on the local flight button he will be taken to the admin local flight JFrame. As user click on the International flight button he will be taken to the admin International flight JFrame.

This is the interface of the menu screen where two button are given i.e admin panel and passenger panel.

The image shows a web application window titled "Passenger Signup". The window has a light blue background and a white border. At the top, there is a title bar with a minimize button, a maximize button, and a close button. Below the title bar, the text "Passenger Signup" is displayed in red. The form contains six input fields: "Name", "Gender", "Age", "CNIC", "Username", and "Password". Each field is a white rectangle with a thin black border. Below the "Password" field, there is a "Signup" button with a blue gradient and white text. At the bottom left, there is a link "Already have account?" followed by a "Login" button with a blue gradient and white text.

Passenger Signup

Name

Gender

Age

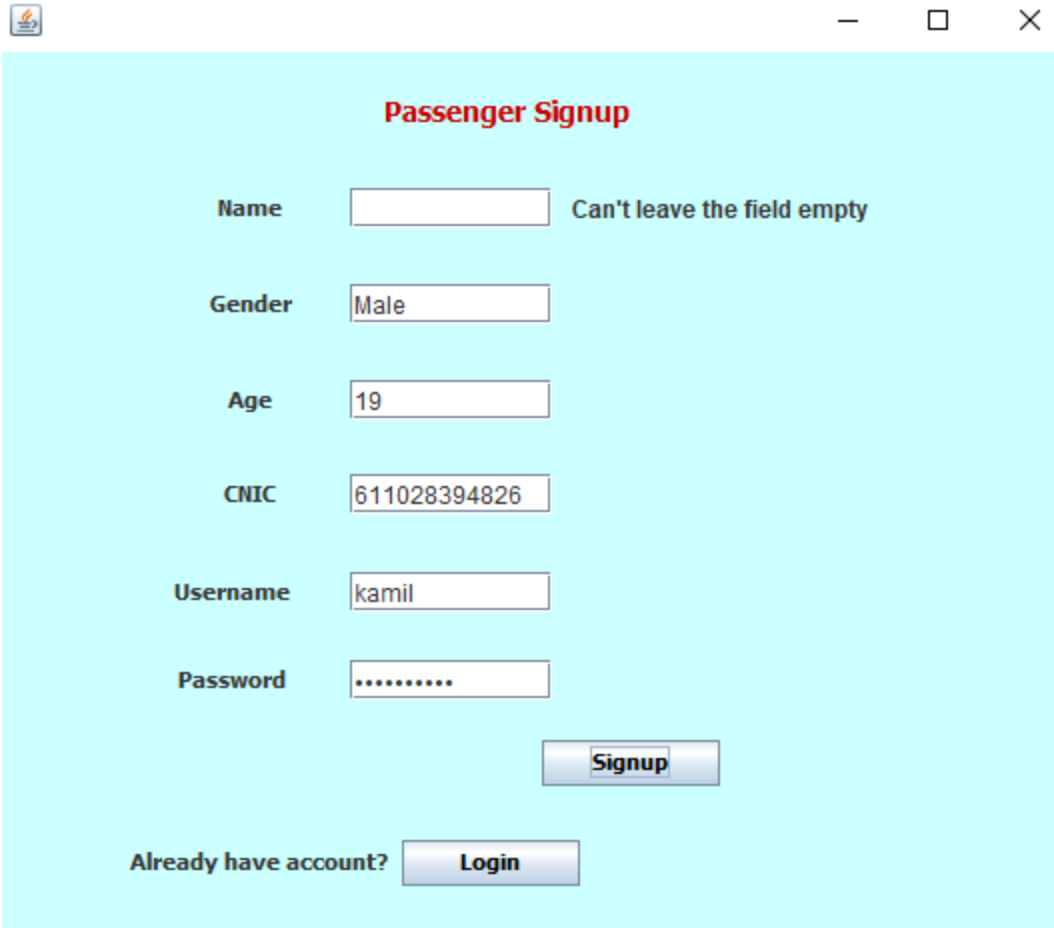

CNIC

Username

Password

Already have account?

When user click on the passenger signup button the following screen will open in front of the user.

Passenger Signup

Name Can't leave the field empty

Gender

Age

CNIC

Username

Password

Already have account?

When any of the field is left empty it will display the message as can't leave the field empty as you see in the pic that I left the name field empty, and it displays that message.

Passenger Signup

Name

Gender

Age

CNIC Format not followed

Username

Password

Already have account?

When cnic is not 13-digit number it will display the message as format not followed.

Passenger Signup

Name

Gender

Age

CNIC

Username

Password Format not followed

Signup

Already have account? **Login**

When

passenger enter the password that is smaller than 8 digit and greater than 16 digit it will display message as format not followed.

Passenger Login

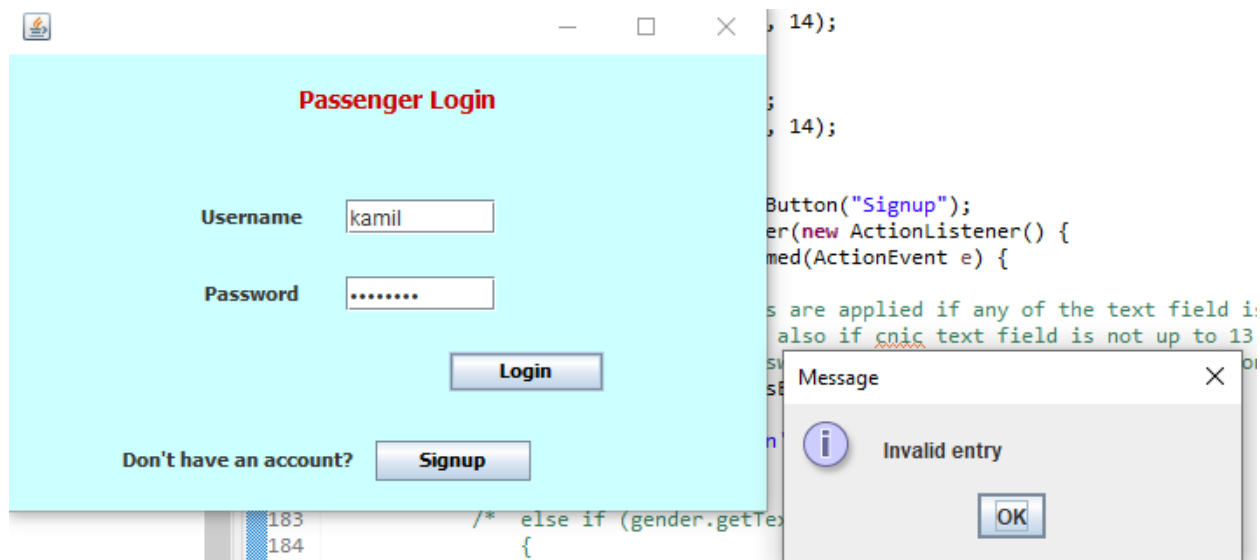

Username

Password

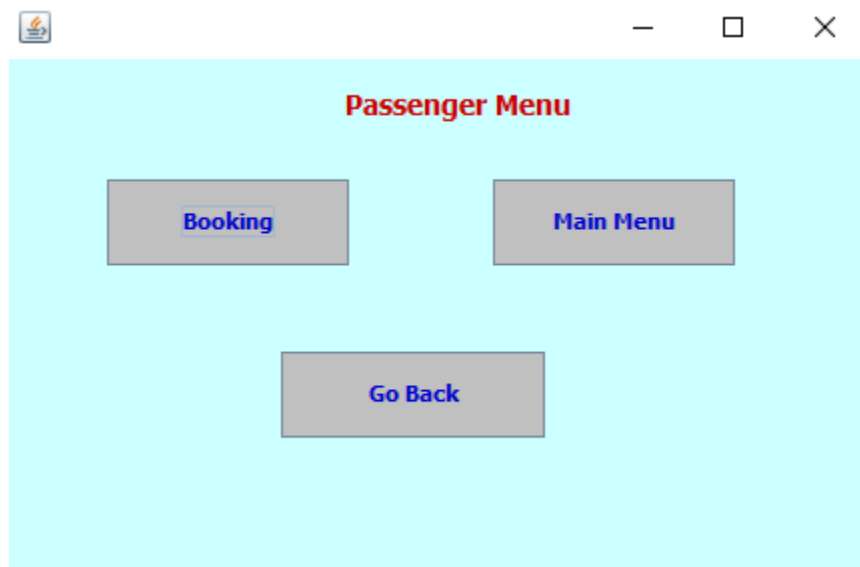

Login

Don't have an account? **Signup**

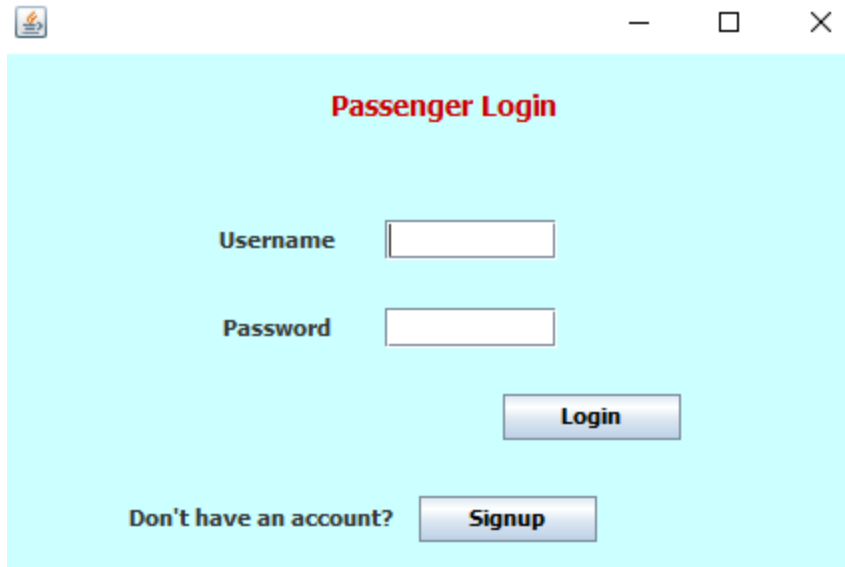

When user enter the signup correctly he will be taken to the passenger login page.

When passenger enter the username and password that did not match the signup ones it will display as invalid entry.

When passenger login successfully he will be on passenger menu here he is given three options booking, main menu and go back

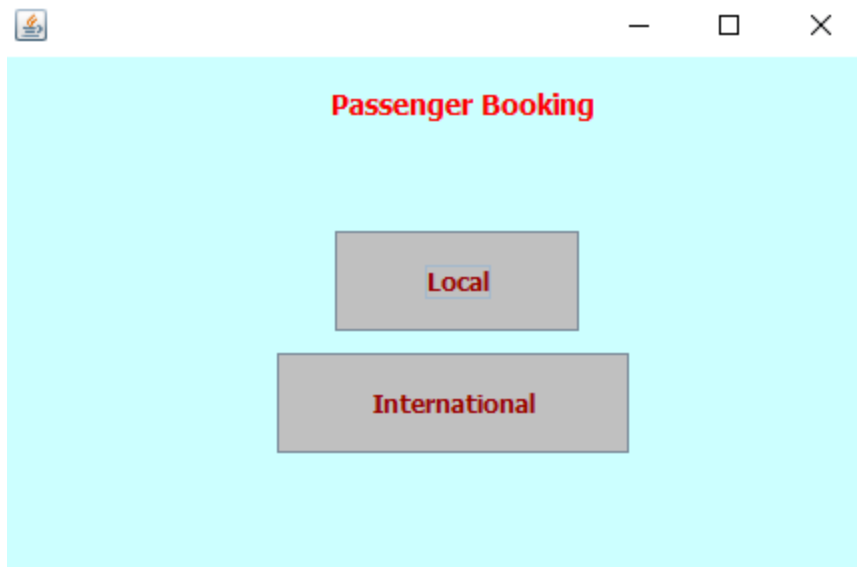

A screenshot of a web application window titled "Passenger Login". The window has a light blue background. At the top, there is a title bar with a small icon on the left and standard window controls (minimize, maximize, close) on the right. The main content area contains the following elements: a red heading "Passenger Login" at the top center; a "Username" label followed by a text input field; a "Password" label followed by a text input field; a "Login" button with a blue gradient and white text, positioned below the password field; and a "Don't have an account?" label followed by a "Signup" button with a blue gradient and white text, positioned at the bottom left.

By clicking on go back he will come back on the login screen.

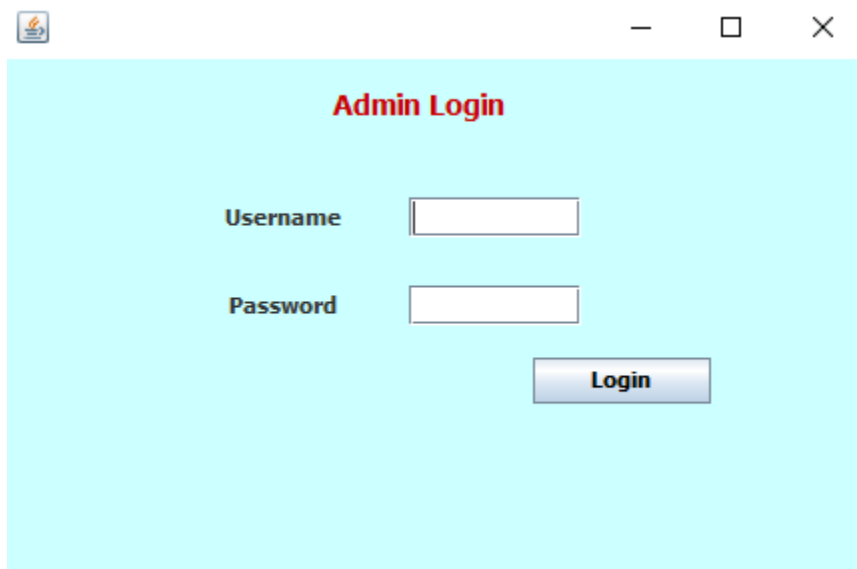

A screenshot of a web application window titled "New-PAK Airline Flight System". The window has a light blue background. At the top, there is a title bar with a small icon on the left and standard window controls (minimize, maximize, close) on the right. The main content area contains the following elements: a red heading "New-PAK Airline Flight System" at the top center; an "Admin Panel" button with a blue gradient and white text, positioned in the center; and a "Passenger Panel" button with a blue gradient and white text, positioned below the Admin Panel button.

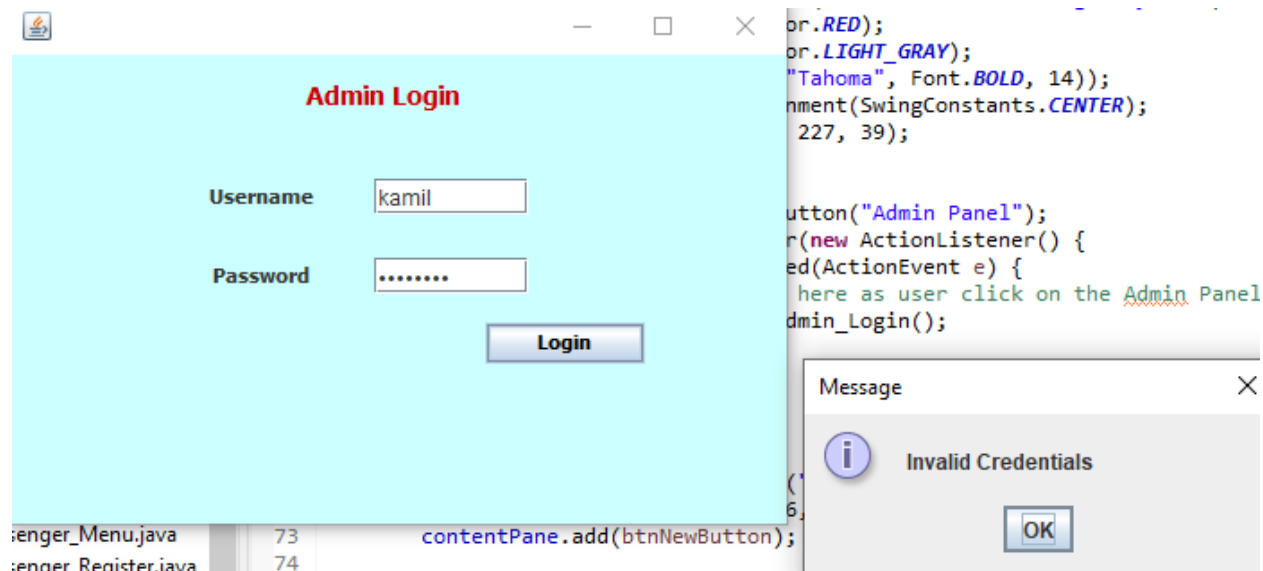

By clicking on the main menu option of the passenger menu he will come on the new Pak airline flight system menu.

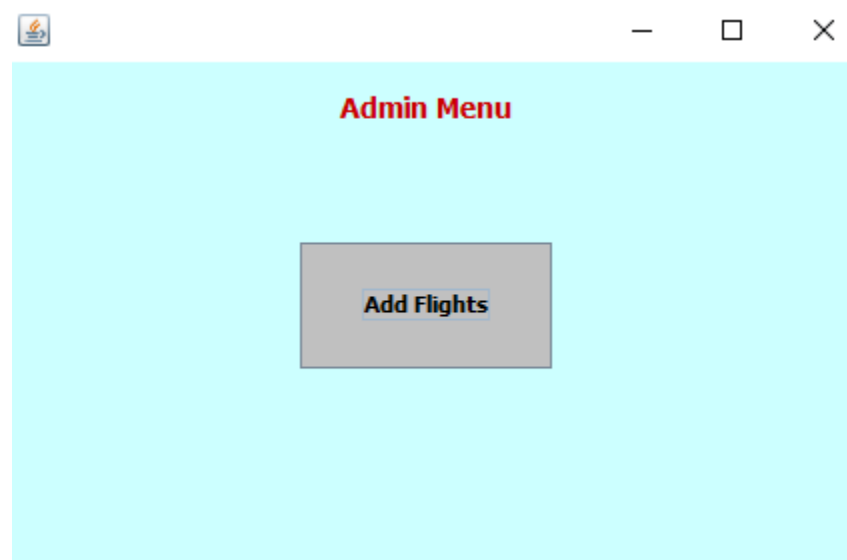

By clicking on the booking option he will be on passenger booking JFrame here two options are given to him local and international.

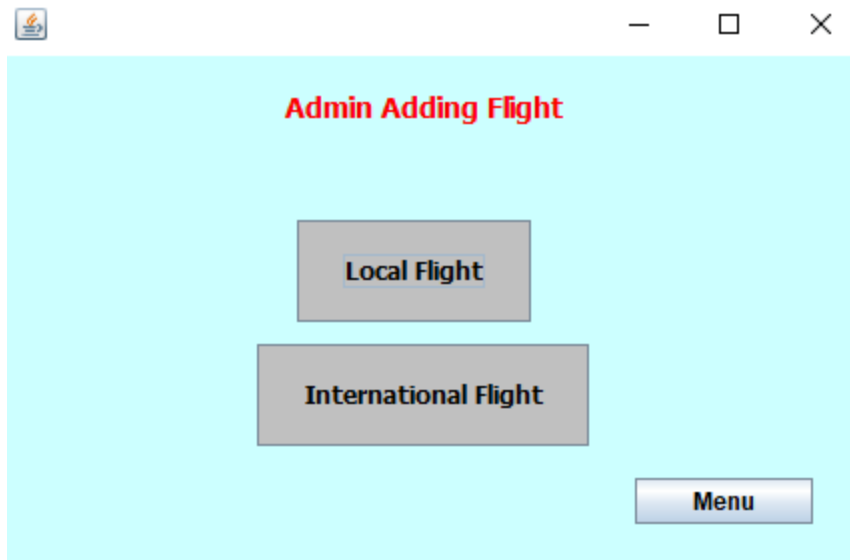

When user click on the main menu option of the passenger menu JFrame and after that he select admin panel then he has to enter his username and password.

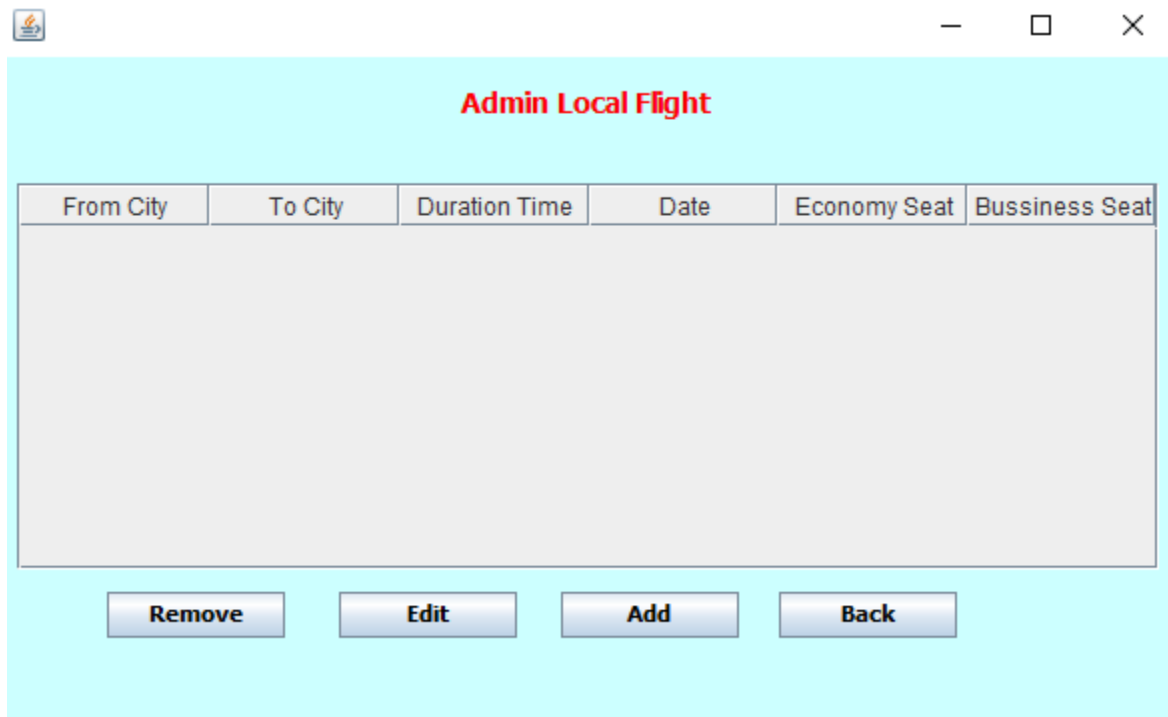

When user do not enter the username or password as it was set for the admin invalid credentials message will be shown

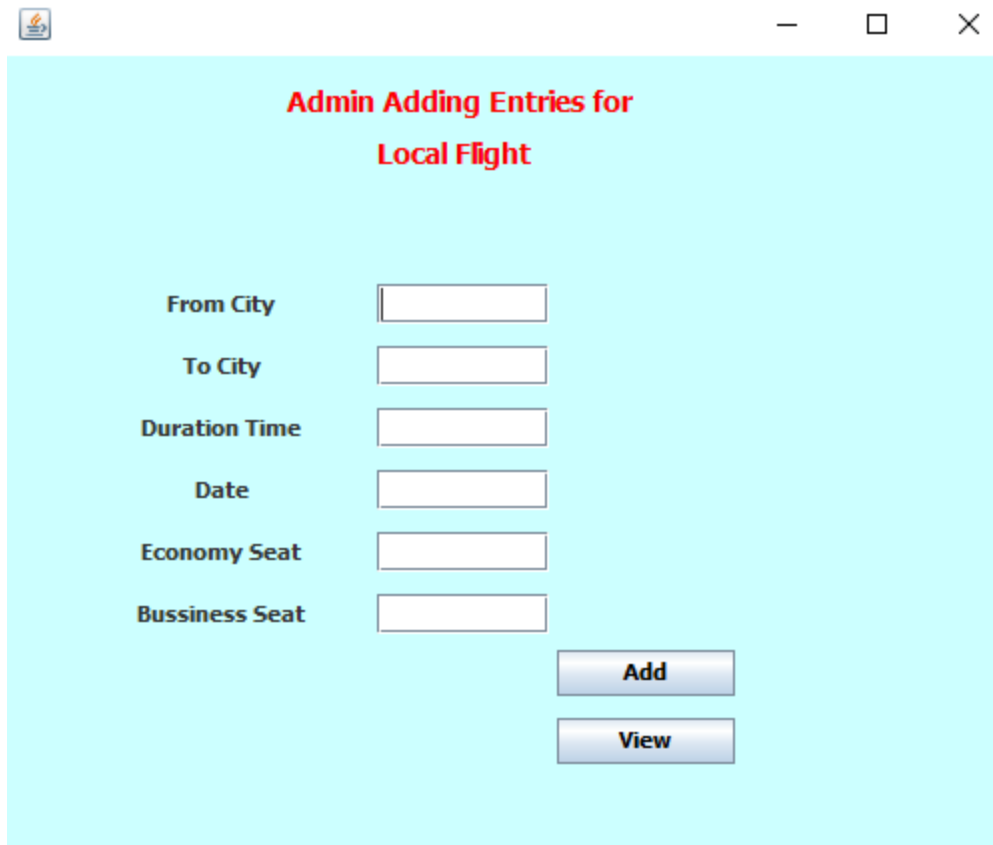

When admin successfully login in to his account he will be on admin menu option here add flights option is given to him.

When admin click on the add flight option then two option will be shown to him i.e local flight and international flight.

When admin click on the local flight the following interface will be open in front of him

**Admin Adding Entries for
Local Flight**

From City

To City

Some Guidelines for Task/Report/Deliverable Submissions

All deadlines should be strictly followed

- All assignments submitted after deadlines will be awarded ZERO marks
- Document text should be well formatted and justified.
- All assignment should use Times New Roman font. Font size details are as follows
 - Heading font size should be 16, should be bold and underlined
 - All sub headings should be of size 14, bold and underlines.
 - All regular text should be of size 12
 - Add captions for all table and figures and cross reference them in your text
- For any query or concerns email at bilal.khalid@nu.edu.pk
